

A SHORT INFRASTRUCTURE VIEW

Work that can find its way back to purpose.

A compact model for keeping objectives, authority, action, and evidence connected as intention becomes distributed work.

An objective begins before it becomes precise.

All work begins, at least in some form, with an idea that reality could be different - or that something worth preserving is at risk.

Perception is situated. Experience, knowledge, biological constitution, social position, and culture influence what becomes visible and which possibilities can be imagined. They do not mechanically determine one conclusion.

The system does not need to model human perception itself. It needs to preserve the attributable transition from a situated perception to a declared, revisable objective.

EARLY OBJECTIVE

At first, intention is often monolithic: direction is felt before destination, constraints, or sequence can be described.

Purpose is present before structure is.

The first infrastructure obligation is modest: retain identity, attribution, and revision without pretending that uncertainty has already been resolved.

The objective gains contour by differentiating - and by returning.

A route may become a Plan, workstream, task, or another bounded form. There is no mandatory ladder. The stable pattern is recursive composition.

The same logic repeats at every altitude: clarify enough to act, preserve the relationship, and allow evidence from the part to revise the whole.

DIFFERENTIATE · ACT · LEARN · REVISE

Precision increases locally while purpose fades globally.

As intention becomes conversations, Plans, research, decisions, specifications, tasks, attempts, and changed files, focused work becomes possible. The explanatory whole becomes harder to see.

A workflow can execute the wrong route correctly.

NOT ONLY TASKS

A task manager can record assignment and status while losing justification and authority.

NOT ONLY DOCUMENTS

A repository can preserve text while leaving semantic and operational relationships implicit.

NOT ONLY ORCHESTRATION

An engine can coordinate agents while omitting the path from intention to accepted effect.

01

Keep local work explainable.

From a task, attempt, artifact, or effect, the system should expose which objective, route, decision, authority, and evidence make it meaningful.

02

Keep high-level intent realizable.

From an objective, the system should expose the Plans, tasks, attempts, effects, and evidence that make progress - or absence - visible.

03

Do not invent missing links.

Purpose, authorization, responsibility, production, and outcome support can meet at one result, but none is proof of another.

The problem is not to put every fact into every task. It is to preserve typed, attributable paths through which the right context can be traversed and materialized when needed.

One outcome. Five questions that must remain separately answerable.

The paths may converge, but a strong link in one cannot repair a missing link in another.

01 PURPOSE	Why does this work exist, and which objective does it serve?	OBJECTIVE → ROUTE → LOCAL WORK
02 AUTHORITY	Which decision permits this action, within what scope and limits?	DECISION → BOUNDARY → EFFECT
03 ASSIGNMENT	Who or what accepted responsibility for this bounded work?	WORK → DISPATCH → ACTOR
04 CAUSATION	Which attempt produced the observed artifact or change?	ATTEMPT → EVENT → EFFECT
05 REALIZATION	What evidence supports the claim that the larger outcome advanced?	EFFECT → EVIDENCE → JUDGMENT

WORKED INSPECTION		Outcome: “The policy checker blocked an unsafe deployment.”		
Purpose Safety objective → release policy	Authority User decision → bounded workflow	Assignment Missing: no actor accepted the check	Causation Attempt 42 → blocked effect	Realization Gate receipt → safety judgment

The effect may be desirable and well evidenced, yet the missing assignment path remains visible. A path may be witnessed, missing, conflicted, or superseded; one path cannot repair another.

Meaning becomes executable through distinct responsibility planes.

No component earns trust alone. Decision, interpretation, execution, mediation, and knowledge responsibilities combine around a durable record.

CONFIRMATION BOUNDARY - PROPOSED

The source proposes two confirmations over one digest plus a fail-closed plan check. Exact confirmation topology remains unsettled.

CRITICAL OWNERSHIP GAP

Authority proof must be verifiable before effects become possible. Whether that belongs to a ninth service or to Record remains unresolved.

A bounded intention becomes a confirmed Dispatch, then attributable evidence.

The ordered control spine is narrow. The supporting infrastructure remains active throughout.

Protocol-instance contract

The saved task DAG records `derived_from`, permitted variation, gates, evidence obligations, and a comparable-shape signature.

Dispatch contract

The confirmed executable shape binds roles, capabilities, prompts, formats, joins, limits, and authority references.

Digest contract

Strategy, DAG, profiles, interpretation, capability resolution, and schema bindings are digestible without pretending rendered prompt text is the source.

Emission contract

Artifacts, claims, evidence, and lifecycle receipts retain authorship, source identity, and relation semantics.

Durability contract

Corrections and later facts append. Current state can be derived without silently replacing the history that made earlier work intelligible.

Closure contract

No successful result while an attempted actor is pending. Join, convergence, terminal close, residue, and reroute remain recoverable.

Available lineage is broad. Materialized execution context should be the smallest coherent slice.

The infrastructure succeeds when parts and wholes can explain each other.

MOVE UPWARD

From local work to justification.

Which work asked for this? Which route produced it? Which objective does it serve? Which decision authorized it? Which assumptions and evidence shaped those choices?

MOVE DOWNWARD

From objective to realization.

Which routes attempt it? Which work is active or blocked? Which decisions changed the route? Which attempts produced effects? What evidence indicates advancement?

Missing links remain visible. The system never manufactures purpose from proximity, authority from acceptance, or realization from activity.

IDENTITY

Can one thing remain addressable while names, locations, classifications, and views change?

SEMANTICS

Do relations such as *part-of*, *authorized-by*, *produced-by*, and *supports* keep distinct meanings?

PROVENANCE

Can an assertion, evidence item, acceptance, and operational authority remain attributable and distinguishable?

WHAT THIS VIEW CLAIMS

Work-context infrastructure should keep purpose, authority, assignment, causation, and realization connected across recursive decomposition and execution.

WHAT REMAINS A HYPOTHESIS

The service split is a candidate architecture, not implementation evidence. Confirmation topology, authority ownership, exact relation vocabulary, and failure behavior still require testing.

OBJECTIVE → ACTION → EVIDENCE → REVISABLE OBJECTIVE
