

Anton's Skills

All my skills have limitations. Therefore, I will write about the skill I have, and the limitations of that skill.

Skills:

1. Everything related to the ABBYY FlexiCapture product. This is a system for recognizing and extracting required attributes from documents. My knowledge of it is at an expert level. In all aspects. From developing recognition templates to writing various libraries in .Net C# for integration with other automated systems.

2. Accordingly, the second skill is C# programming.

Limitations for these two skills:

1. ABBYY left our country. Therefore, I haven't touched ABBYY products for the last four years.

2. Although my libraries work at the largest bank in the Russian Federation in very high-load solutions, I am not a professional programmer. I am self-taught. Therefore, I understand perfectly well that my code is far from perfect.

3. DevOPS. I used Ansible in Jenkins. But I mostly reused existing solutions. Some things I wrote myself. So, I understand the overall structure. I could probably write something from scratch, but I'm far from an expert.

4. AI. I built and optimized inference with a local model for my hardware. On Linux and Windows. But here it's at a high level: downloading the llama.cpp source code, building a distribution from it. And using a running server with a model. For example, for writing code. Or for a shared agent, like hermes.

5. Technical support. This is related to points 1 and 2 in my skills. Troubleshooting problems that arise during work. Debugging. Searching for information in logs. Thorough analysis of the situation, as much as possible, to solve problems.

In terms of my preferences, what I like:

1. Programming.

2. I'm very interested in the AI field. For example, creating agents. But I haven't created a single agent myself yet. I use ready-made ones.
