DOCUMENT CAPTURE & INTEGRATION ENGINEER / ABBYY FLEXICAPTURE, C#, LOCAL AI

How I got here

I came to software through document capture. I worked at expert level with ABBYY FlexiCapture, a system that recognizes documents and extracts the attributes a business needs, from designing recognition templates to writing .NET C# libraries that integrate it with other automated systems. Those libraries run in high-load production at the largest bank in the Russian Federation.

I am self-taught rather than a formally trained programmer, so I treat my code as improvable, not finished. ABBYY has left the country and I have not worked hands-on with its products for the last four years; the engineering judgment the work required stayed with me.

What I do

I make document and integration systems work in production, and I find out why they stop working.

CAPTURE	INTEGRATE	DELIVER	DIAGNOSE
Design recognition templates that extract the attributes the business actually needs	Write .NET C# libraries that connect capture to the surrounding automated systems	Ship with Ansible and Jenkins, mostly adapting existing pipelines rather than authoring them	Debug, read logs, and analyze a failing situation as far as it takes to solve it

What I am building now

I build and optimize local model inference on my own hardware, on both Linux and Windows: compiling llama.cpp from source, producing a working distribution, and running the server with a model for writing code or driving a general agent such as Hermes.

AI is where I want to go next, and I am explicit about the gap. So far I have used ready-made agents and have not built one myself; closing that distance, from running someone else's agent to designing my own, is the work I want. Programming is the part I enjoy most, and agents are where I want to spend it.
